VIII CBSE

Academic Conquest - I

Answer Key – Resources (Ch. 9)

SECTION A – MCQ

1. (c) Wool
2. (b) Localized resources
3. (c) Railway
4. (c) Millions of years to regenerate
5. (b) Actual resources
6. (b) Afforestation
7. (b) Reuse
8. (i) Both A and R are true, and R is the correct explanation of A.

SECTION B – Very Short Answer

1. A resource is anything that fulfils human needs. Examples: air, water (any two valid examples such as food, minerals, forests).
2. Human resource refers to the people of a country, especially those who are educated, skilled, and disciplined, who can turn raw materials into finished products.
3. Biotic resources come from living things, e.g. crops, wool, leather. Abiotic resources are derived from non-living things, e.g. minerals, soil, sand.
4. Sustainable development means using resources carefully without harming the environment, so that future generations can also benefit — taking only what is needed now and avoiding waste.

SECTION C – Short Answer

1. Actual resources are those about which we have definite knowledge of their location, quantity, and the technology to exploit and use them, e.g. mineral deposits of the Chota Nagpur Plateau. Potential resources are those about which we do not have enough precise knowledge or the facility to exploit them at present, e.g. natural gas deposits in the Rajasthan desert.
2. Educated and healthy young men and women help their country grow and improve; skilled and disciplined people can convert raw materials into valuable finished products (e.g. raw cotton into fabric and clothes), which is why countries with large populations but without proper education, healthcare, and opportunities remain underdeveloped.
3. Any three of: practising the 3 R's (Reduce, Reuse, Recycle); avoiding over-exploitation such as deforestation, over-mining, and over-fishing; promoting afforestation; using resources wisely and only taking what is needed; protecting resources for future generations through sustainable development.

SECTION D – Long Answer

1. Natural resources are classified on four bases (any four):

1. Based on origin – Biotic (living things, e.g. plants, wool) and Abiotic (non-living things, e.g. minerals, soil).

2. Based on distribution – Ubiquitous (found everywhere, e.g. air, water) and Localized (found in specific places, e.g. coal, minerals).

3. Based on renewability – Renewable (can be regenerated, e.g. solar energy, plants) and Non-renewable (take millions of years to regenerate, e.g. petroleum, natural gas).

4. Based on level of development – Actual (known and usable now, e.g. oil reserves of the Gulf region) and Potential (not yet fully known or tapped, e.g. natural gas deposits in the Rajasthan desert).
