ANSWER KEY

Subject: Geography (NCERT) – Ch 9 Resources; Ch 10 Land, Soil, Water, Natural Vegetation and Wildlife Resources

Time: 1 Hour **Max. Marks: 30**

SECTION A **6**

1. (b) Bridge 2. (a) ubiquitous 3. (d) Coal 4. (c) soil erosion 5. (b) Sundarbans 6. (a) tropical deciduous [1 mark each]

SECTION B (2 marks each) **8**

7. Sustainable development means carefully using resources so that, besides meeting the needs of the present, we also conserve them for the needs of future generations. [2]
8. Renewable resources can be replenished or reproduced by physical, chemical or mechanical processes (e.g. sunlight, wind, water). Non-renewable resources have a limited stock; once used they cannot be replaced quickly, as they take millions of years to form (e.g. coal, petroleum). [1 + 1]
9. Physical factors – topography, soil, climate, minerals and availability of water; human factors – population and technology. (Any two, 1 mark each)
10. Any two : (1) Plants and animals maintain the ecological balance and the biodiversity of the earth. (2) Forests and wildlife give us food, timber, medicines, oxygen and raw materials. (3) Many species are becoming extinct due to deforestation and hunting, so protection is needed for future generations. (1 mark each)

SECTION C (4 marks each) **12**

11. Humans are essential components of resources. Natural materials become resources only when humans, with their knowledge, skills and technology, transform them into something useful (for example, iron ore becomes useful only after humans learn to extract and use it; coal and petroleum became resources after technology developed). Human activities such as education and health also make people a valuable 'human resource'. [4]

    OR Actual resources – those whose quantity is known and which are being used at present (e.g. coal, petroleum, water, forests). Potential resources – those whose entire quantity may not be known or used at present but may be used in the future with better technology (e.g. solar and wind energy in Rajasthan and Gujarat; water in the Himalayan region). [2 + 2]
12. Any four methods (1 mark each) : Mulching – covering the bare ground with a layer of organic matter; Contour barriers – stones, grass and soil used to build barriers along contours; Rock dam – piling rocks to slow the flow of water and prevent gullies; Terrace farming – cutting steps on slopes; Intercropping – growing different crops in alternate rows; Contour ploughing – ploughing along the contour lines; Shelter belts – planting rows of trees to check wind erosion in dry regions.

    OR Factors of soil formation (any four, 1 mark each) : parent rock (nature of rocks and their weathering), climate (temperature and rainfall), relief/topography, flora and fauna (organic matter and humus), time taken for formation. Weathering by temperature changes, running water, wind and glaciers breaks rocks into small particles.
13. Features (any three, 3 marks) : also called monsoon forests; found in areas with moderate rainfall; trees shed their leaves in the dry season to conserve water; found in the plains of India, parts of Madhya

Pradesh, Uttar Pradesh, Bihar, Jharkhand, Odisha, Chhattisgarh, parts of the Western Ghats; important commercial timber. Trees (any two, 1 mark) : teak, sal, shisham, neem, sandalwood, khair, mulberry.

OR Importance (any three, 3 marks) : mangroves grow in coastal areas and protect the coast from storms, tides and erosion; they provide shelter and breeding grounds for fish and birds; they give timber, fuel and fish to coastal communities; they keep the coastal ecosystem healthy. Location (1 mark) : Sundarbans in West Bengal (Sundari tree) and other coastal deltas such as those of the Mahanadi, Godavari and Krishna.

SECTION D **4**

14. (i) Farmers have dug deeper borewells and are drawing out too much groundwater, while rainwater is not recharging it because it flows away. [1]

(ii) Rainwater harvesting. [1]

(iii) Any two (1 mark each) : build check dams and ponds; recharge groundwater through percolation pits; use drip irrigation; repair leaking pipes and taps; plant trees to hold water in the soil; avoid wasting water; reuse water.
